Refining ceramics
Brilliant effects on BOTZ glazes
BOTZ PLUS - the liquid effect intensifier for the firing range from 1150° – 1250°C

BOTZ offers a wide colour range of well-proven brush-on glazes for creative ceramics design. In order to refine the glaze finish, to make optimum use of its possibilities - even to extend them - we have now developed BOTZ PLUS.

**BOTZ PLUS increases the effects** particularly nicely on BOTZ stoneware glazes and distinctly increases the brilliance of the ceramics. Use BOTZ PLUS to recombine the substances of the glaze contents combine during firing - dependent on the layer thickness - and change the colours, structures and the brilliance. With BOTZ PLUS, you can even reduce the firing range of the stoneware glazes to 1150°C.

**Application** is extremely simple: before firing, use the brush to apply BOTZ PLUS to the glaze in 1–3 layers as the last layer and let it dry. Blending in different layer thicknesses provides particularly attractive results. Caution: for vessels, only apply a thin layer to the bottom area. BOTZ PLUS can be applied evenly or unevenly and also stirred into the glaze. Likewise, you can use BOTZ PLUS straight or combined and mixed with other BOTZ products. Simply experiment, you’ll love the results!

For all BOTZ products, the following applies: they are all **non-toxic**, i.e. they are lead free and do not contain any concentration level of hazardous substances whose indication is required in compliance with the Regulations on Hazardous Substances. Available in 200 and 800 ml jars.

**TIP:** Use of BOTZ PLUS in the firing range of 1150°C will also yield excellent firing results. Figure on the left: BOTZ Stoneware 9885 mixed with 9800 SPS 10:1 + BOTZ PLUS fired at 1150°C.
